Assistance and Outsourcing

1. **Cancer Genetics:** Studying genetic mutations that lead to cancer and understanding how these genetic changes drive tumor growth.
2. **Cancer Epidemiology:** Investigating the distribution, determinants, and frequency of cancer within populations to identify risk factors and effective prevention strategies.
3. **Chemotherapy:** Developing and testing chemical agents to discover effective cytotoxic compounds for cancer treatment.
4. **Immunotherapy:** Enhancing the body's immune response against cancer cells through the development of vaccines and other immune-based treatments.
5. **Targeted Therapy:** Designing drugs that specifically target cancer cells based on their genetic, protein, or environmental differences from normal cells.
6. **Radiation Therapy:** Optimizing the use of radiation to treat cancer by studying its effects on tumor cells and surrounding tissues.
